HISTORY

I have always loved trains, and I noticed that the wonderful X-Plane habitat is populated with planes of all shapes and sizes, an assortment of ground vehicles, and a handful of boats . . . but no trains.

The goal of this project was to create a working model of an electric railcar based on Peninsular Railway Car #52. The original car (still operational today) was built by the American Car Company in St. Louis in 1903 for the San Jose – Los Gatos Interurban Railway Company.

This resulting X-Train model includes an operational train controller, photo-realistic interior views and authentic sound effects to complete the sim-rail experience.

peninsular #52 on the way to stanford university

ride the rails of the x-plane world

This product is the result of countless hours of research, design and construction – including a local train ride with a digital camera. I hope you enjoy your X-Train experience.

For more information about Peninsular Railway Car #52, including how to take a ride, see: www.wrm.org

FEATURES

- realistic body design and paint, lighting
- photo-realistic interior views
- custom engine, rail, bell and horn sounds
- custom cockpit with functioning controller
- train operation manual included

X-Train Peninsular can be completely controlled with only a mouse. A flight yoke works great for steering. The horn can be accessed manually or use your flaps key. Doors are controlled via the speedbrakes.
